Low-Code Experiment

Exploring AI-Assisted Features and Built-in Analytics (Zia) in Zoho Creator

Abstract
This experiment explores the AI-assisted features and built-in analytics of Zoho Creator. The Room Booking Form builder was examined for Zia and its field groups, the Zia option for building forms with AI was opened and the platform's access requirement was recorded, and the built-in analytics of the application, namely the charts and Board of the Booking Dashboard, were reviewed with live booking data.

1. Aim
To explore the AI-assisted features and built-in analytics provided by Zia in Zoho Creator.

2. Concepts
Zia. Zoho's AI assistant. In Creator it supports building apps and forms with AI, and AI-assisted fields and search. Using it requires a paid plan and an LLM of the user's choice configured in the Zia settings, and the Zia features relevant to the account must be enabled.

Form builder field groups. The left panel of the Form Builder groups fields into Basic, Advanced (for example Decision box, Rich Text, Url, Image, Percent, Currency) and Special Fields (Section, Add Notes, Users, Integration, AR).

Built-in analytics. Charts, Boards and reports built from the form data without writing code. The Booking Dashboard from Experiment 5 summarises bookings by room type and meal plan.

Use case. Zia could help the front desk by analysing special requests, while the dashboard already gives the manager a quick view of room demand.

3. Procedure
1. Open the Room Booking Form in the Design tab and review the field palette on the left: the Advanced Fields and Special Fields groups.
2. Select a field (Guest Name) and review Field Properties on the right: field name, link name (Guest_Name), the Mandatory validation and the display fields.
3. Click the Zia option on the form canvas to open Building apps and forms with Zia, and note the access conditions it shows.
4. Open the live Booking Dashboard and review the Board, the pie chart (guests by room type) and the column chart (bookings by meal plan) as the built-in analytics.
5. Hover over a chart segment to read the value, for example the number of guests for a room type.

4. Implementation Screenshots (HOTEL BOOKING application)

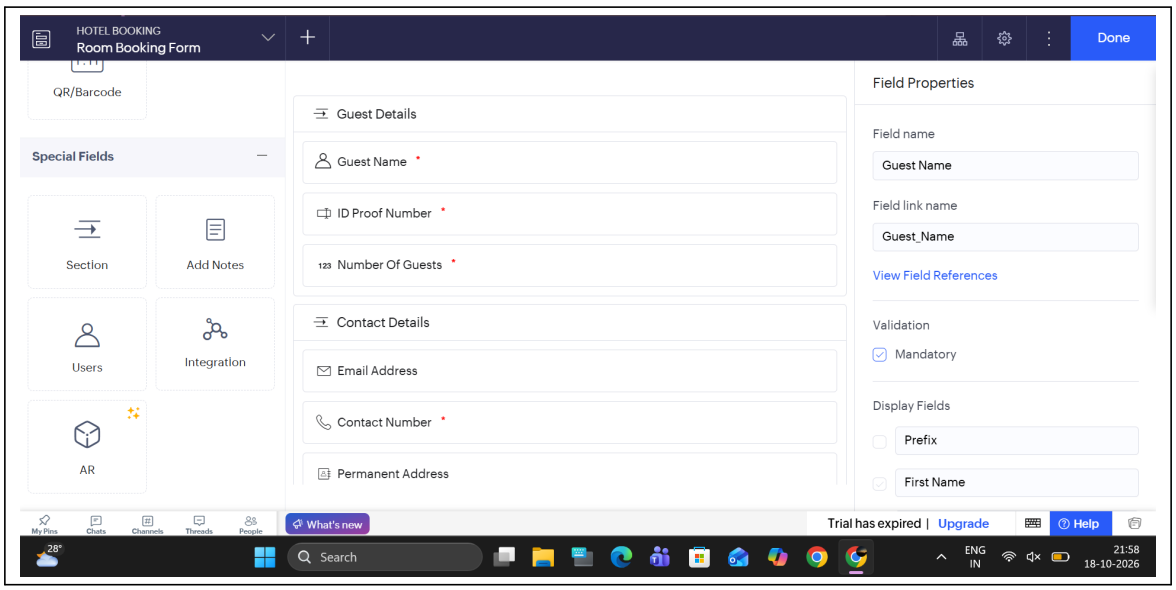

Figure 1: Form Builder palette (Special Fields group) and Field Properties of Guest Name, with the field link name

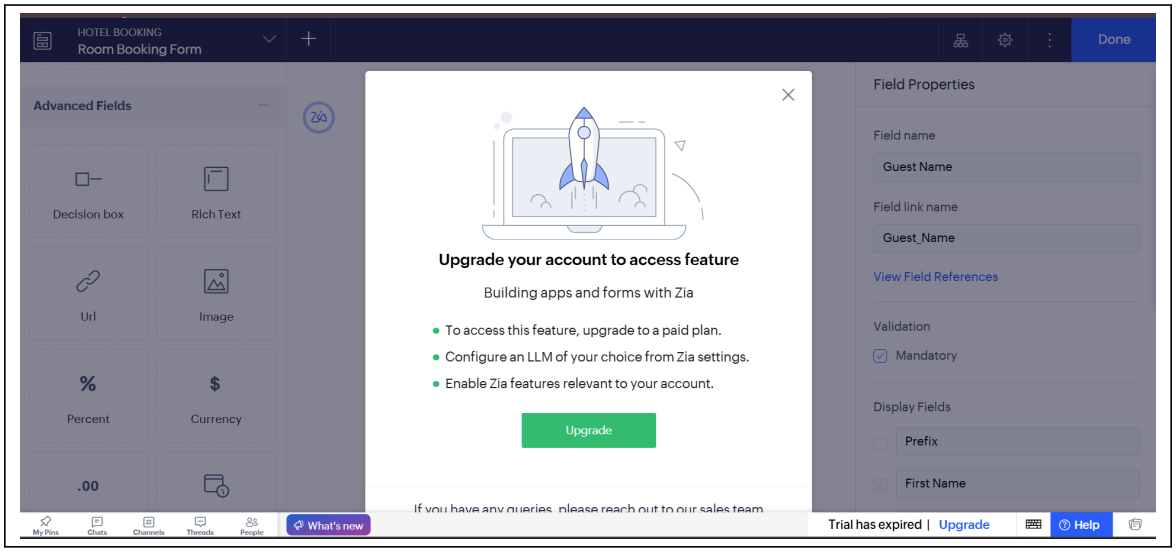

Figure 2: Zia option in the Form Builder: Upgrade your account to access feature

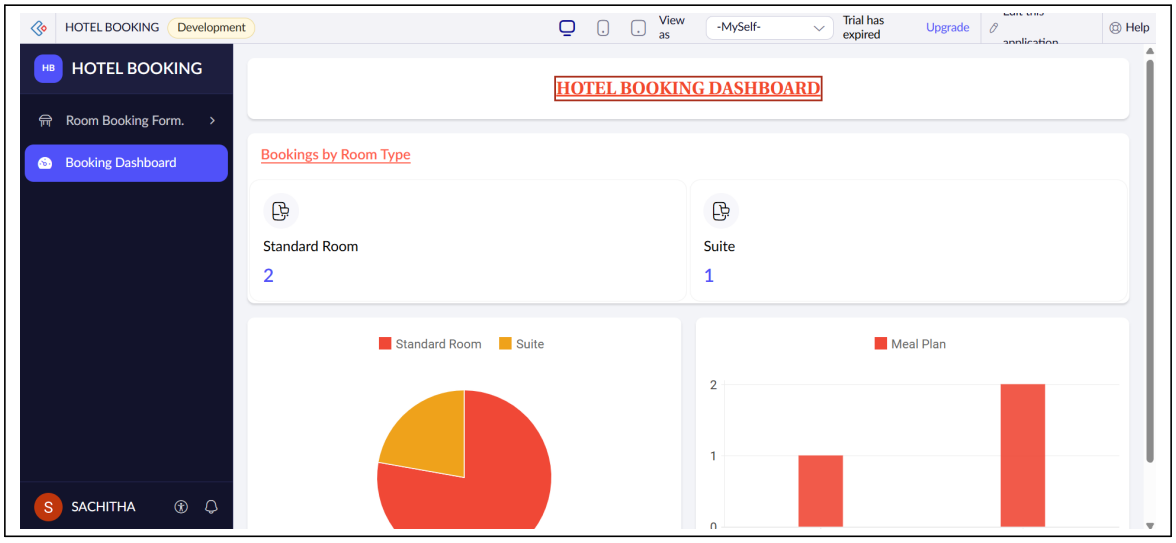

Figure 3: Built-in analytics: live Booking Dashboard with the Board and charts (built in Experiment 5)

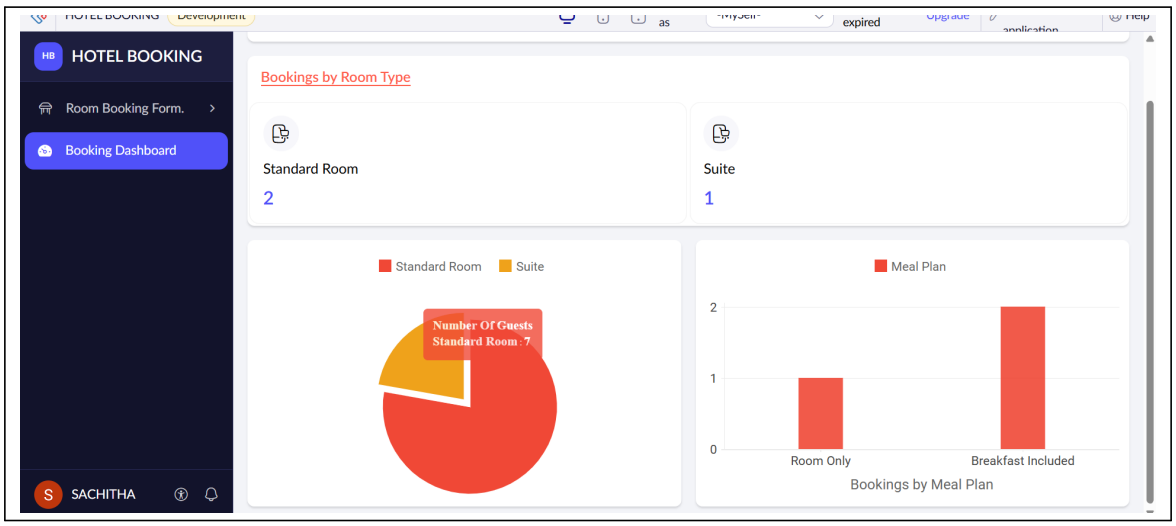

Figure 4: Chart tooltip showing the number of guests for Standard Room (built in Experiment 5)

5. Expected Output

The Zia form-building option is not available on the expired trial: Zoho Creator asks the user to upgrade to a paid plan, configure an LLM in the Zia settings and enable the relevant Zia features. The built-in analytics work with the existing data, and the dashboard shows 2 Standard Room and 1 Suite booking, guests by room type and bookings by meal plan.

6. Result

The procedure above was prepared for the HOTEL BOOKING application. The observed results are recorded through the screenshots in the figures above. Where a feature is restricted because the free trial has expired, the message shown by Zoho Creator is included as the screenshot and treated as the observed result.

7. Learning Outcome

Learnt what Zia offers in Zoho Creator and what it needs (a paid plan, a configured LLM and enabled Zia features), how the form builder groups its fields, and how the built-in charts and Board provide analytics on form data without code.
